SUMMARY

CIS REPLACEMENT PROGRAM (In 2021 \$)			
A. CS - CIS Replacement Program	2021 Adjusted-Recorded (000s)	TY2024 Estimated (000s)	Change (000s)
1. CS - CIS Replacement Program	\$ 1,815	\$ 20,247	\$18,432
Total	\$ 1,815	\$ 20,247	\$ 18,432

Southern California Gas Company (SoCalGas or the Company) requests the California Public Utilities Commission (CPUC or Commission) adopt its General Rate Case (GRC) forecast of \$20.2 million for 2024 for operations and maintenance (O&M) non-shared services activities for SoCalGas’s Customer Information System (CIS) Replacement Program. SoCalGas further requests the Commission adopt its Capital forecast of \$4.9 million, \$2.7 million, \$93.3 million, \$74.1 million, and \$46.6 million for capital expenditures in years 2022, 2023, 2024, 2025, and 2026, respectively, for SoCalGas’s Customer Information System Replacement Program to be included within the Post Test Year Ratemaking request of Khai Nguyen (Exhibit SCG-40).

SoCalGas’s legacy CIS is a large-scale information technology system that was implemented decades ago and is rapidly approaching obsolescence. CIS is foundational to serving SoCalGas’s 5.9 million accounts and 21.8 million customers. CIS supports SoCalGas’s critical customer service business processes and customer engagement functions, including: calculating and generating over 70 million bills per year; processing 55 million annual payments; supporting more than 12 million customer interactions (*e.g.*, phone, web, branch office); and managing credit, collections, and account receivables. CIS also supports meter data; service orders; account management and customer care; rates and programs; and customer information. The obsolete technology of the legacy CIS is difficult to maintain and enhance, and overdue for replacement. SoCalGas must replace its outdated CIS with a new, modernized CIS platform to enable implementation of increasingly complex California regulatory requirements and keep pace with the rapidly changing energy industry and evolving service demands of customers. Replacing CIS will elevate the service and support customers receive. For example, the new CIS will allow for a more customer-centric way of doing business by moving all customer data to one consolidated location, enabling SoCalGas to more effectively implement new programs and services providing customers with significantly improved experiences. The new system will also

support deployment of new features and functions, offering greater configurability and flexibility, and will make implementation of mandated changes quicker and more cost-effective.

**PREPARED DIRECT TESTIMONY OF
EVAN D. GOLDMAN
(CUSTOMER INFORMATION SYSTEM REPLACEMENT PROGRAM)**

5 **I. INTRODUCTION**

6 **A. Summary of Customer Information System Replacement Program Costs and**
7 **Activities**

8 My testimony describes SoCalGas’s plans to replace its current (legacy) CIS and
9 supporting subsystems. At the time of the proposed implementation of a new CIS system,
10 SoCalGas’s legacy CIS will have been operating for over 30 years and based on technology that
11 will be over 40 years old.¹ CIS is the technology foundation of numerous critical operations
12 within the SoCalGas Customer Services organization, and it is important that the legacy system
13 is replaced prior to experiencing the types of failures encountered by comparable utilities using
14 similarly aged systems. Implementing a new CIS will enable the capability and agility necessary
15 to meet evolving business and regulatory requirements while also supporting climate goals and
16 providing enhanced cybersecurity. In addition, a new CIS will allow SoCalGas to provide
17 modern customer service experiences not possible in the legacy system. The replacement is
18 anticipated to start in 2024 and go in service in 2026. My testimony and supporting workpapers
19 include O&M and capital forecasts for the CIS Replacement Program, which includes planning,
20 implementing, and stabilizing the new CIS. Test Year O&M forecasts reflect a normalization of
21 the estimated O&M costs over the rate case period (2024-2027). The capital forecasts reflect
22 expenditures anticipated to be incurred until implementation is completed in 2026. The rationale
23 for and details of SoCalGas’s proposal to replace its CIS and related subsystems are discussed in
24 more detail below. Table EG-1 summarizes my sponsored O&M costs.

¹ SoCalGas’s legacy CIS is based on Andersen Consulting (Accenture) Customer/1 software originally developed in 1985.

1
2

TABLE EG-1
Test Year 2024 Summary of Total O&M Costs

CIS REPLACEMENT PROGRAM (in 2021\$)			
O&M	2021 Adjusted-Recorded (\$000)²	Estimated TY 2024 (\$000)	Change (\$000)
Non-Shared	\$ 1,815	\$ 20,247	\$ 18,432
Shared	\$ 0	\$ 0	\$ 0
Total O&M	\$ 1,815	\$ 20,247	\$ 18,432

14

15

CIS is the critical and foundational information technology system facilitating core customer service transactions and account management for SoCalGas’s customers. CIS manages essential functions including billing calculations, payment processing, and credit and collections activity. It is the primary system used by Customer Services Representatives (CSRs) when interacting with customers, and it provides the underlying data and information to support the Company’s Interactive Voice Response (IVR) and Digital channels (“My Account”). In addition, the system generates most service orders requested by customers for completion by the Customer Services Field (CSF) team. CIS integrates with more than 50 systems across multiple departments. Many of the integrated systems, including Meter Data Management System, Workforce Management System, and various external payment processing systems, depend on CIS as their key data source for information about SoCalGas customers and their interactions with the utility.

16

17

18

19

20

21

22

23

24

25

SoCalGas’s legacy CIS is an outdated, mainframe-based system implemented in 1996 as a customized version of Andersen Consulting’s (now Accenture) Customer/1 CIS software. CIS was built with technologies including Mainframe COBOL, DB2, and Smalltalk. The legacy CIS was developed to support business processes in place at that time, including manual meter read and paper billing, with most transactions occurring in person at branch offices, via U.S. mail, or by phone. The legacy CIS is designed around premise or location of service, as opposed to modern systems, which are designed as “customer-centric.” Limitations associated with SoCalGas’s premise-based system include lack of flexibility to deliver personalized service, as the system is not designed to easily capture or use customer-specific preferences for communications, engagement channels, and programs. The premise-based system also limits the

² The 2021 adjusted recorded expenses are costs to complete a CIS replacement study.

1 ability to maintain multiple customer relationships for one account. In contrast, a customer-
2 based system allows for targeted communications to multiple contacts at a premise, *e.g.*, specific
3 communication to a business’s account manager regarding billing and separate communication
4 to the facilities manager regarding energy usage.

5 Over the decades since implementation, the legacy CIS has become increasingly complex
6 and difficult to support as it has been continuously modified to meet evolving regulatory,
7 legislative, customer, and business driven changes. For example, the system changes required to
8 comply with the California Consumer Privacy Act (CCPA) were challenging and time-
9 consuming to implement due to the multiple and varied systems that currently house customer
10 information. The CCPA provides consumers the right to make formal requests to know how
11 their data is being used; to know the categories of information a business collects, shares, and
12 sells; to request deletion of personal information (when the information is not exempted); to
13 download personal information; and to opt out of the sale of personal information. Lack of
14 centralized customer data makes the data collection, retrieval, and deletion process particularly
15 challenging and time-consuming in the legacy CIS environment. The efforts and manual
16 processes required to comply with CCPA would not have been as complex with a modern CIS.

17 SoCalGas’s customer data is currently not stored in a single location due to extensive
18 modifications and new integrated subsystems that have been added since the legacy CIS was
19 implemented. The lack of centralization prevents a real-time comprehensive view of customer
20 data and therefore limits opportunities to provide personalized and more efficient customer
21 experiences. Rapid advances in technology require a flexible and agile CIS to allow for timely
22 response to regulatory requirements, customer expectations, and emerging business needs.
23 SoCalGas’s proposed solution to replace CIS will enable more effective and efficient
24 implementation of new requirements and provide customers with an improved, customer-centric
25 service experience.

26 In the TY 2019 GRC, SoCalGas requested and was authorized funding to study the
27 replacement of CIS.³ To assist with the study, SoCalGas hired Accenture, a multinational
28 Fortune Global 500 professional services company that specializes in information technology

³ 2019 GRC, Workpapers to Prepared Direct Testimony of SoCalGas Witness Christopher R. Olmsted (Exhibit SCG-26-WP) at 6.

1 services and consulting. Accenture has implemented more than 250 CIS solutions in the global
2 utility industry over the past 40 years and is currently supporting delivery of the five largest CIS
3 programs in the world. Accenture’s established framework was leveraged to assess the legacy
4 CIS and to examine the importance of and rationale for replacement. The assessment by
5 SoCalGas and Accenture determined that further investment in the existing CIS platform will
6 build upon a system that is already technically obsolete and very complex to maintain and
7 enhance. The assessment concluded that replacing the legacy CIS was the best strategy. Key
8 drivers for CIS replacement include:

- 9 • solving the problems of technology obsolescence and complexity with the
10 legacy CIS;
- 11 • establishing a technology platform that can meet future business and
12 regulatory requirements;
- 13 • implementing a “living” system that is sustainable, upgradeable, and
14 resilient;
- 15 • enabling modern customer experiences to meet changing customer
16 expectations; and
- 17 • evolving customer relationships in support of SoCalGas’s ASPIRE 2045
18 climate commitment.

19 Replacing SoCalGas’s aging legacy CIS is consistent with the investments of industry
20 peers. All large investor-owned utilities in California and more than 80% of comparable utilities
21 in North America have either replaced or are in the process of replacing their legacy CIS. The
22 importance of replacing SoCalGas’s legacy CIS along with a discussion of proposed timing,
23 scope, and cost of implementation is discussed in greater detail within my testimony.

24 **B. Support To and From Other Witnesses**

25 My testimony also references the testimony and workpapers of several other witnesses,
26 either in support of their testimony or as referential support for mine. These include the
27 following:

- 28 • Information Technology Modernization Policy testimony of Ben W. Gordon
29 (Exhibit SCG-02, Chapter 1);
- 30 • Sustainability Policy testimony of Michelle Sim (Exhibit SCG-02, Chapter 2);
- 31 • Rate Base testimony of Patrick Moersen (Exhibit SCG-31); and
- 32 • Post-Test Year Ratemaking testimony of Khai Nguyen (Exhibit SCG-40).

33

1 **C. Organization of Testimony**

2 My testimony is organized as follows:

- 3 • Introduction
- 4 • Importance of implementing new CIS
- 5 • Sustainability
- 6 • Risks associated with sustaining and modifying existing system
- 7 • Timing of CIS replacement
- 8 • Selection of new CIS
- 9 • Solution plan and scope
- 10 • Implementation plan and costs
- 11 • Conclusion.

12 **II. IMPORTANCE OF IMPLEMENTING NEW CIS**

13 SoCalGas’s legacy CIS has become challenging to maintain and enhance. Technology
14 obsolescence, implementation of increasingly complex regulatory requirements, and an
15 exponential increase in the amount of data processed in the CIS system have all contributed to
16 maintenance and operational challenges. A significant number of new CIS subsystems and
17 integrations between the legacy CIS and other systems have also been added over the years as
18 the energy market, regulatory requirements, and the relationship between the customer and the
19 utility has transformed. As a result, SoCalGas faces increased risk of system instability and even
20 system failure.

21 Over nearly three decades, layer upon layer of complex customizations and integrations
22 have made it challenging to maintain and continue to enhance the legacy CIS. In addition, as the
23 system ages, the number of technical resources with critical knowledge of the legacy CIS
24 programming languages and support tools continues to shrink. Resources with the institutional
25 business knowledge and experience necessary to operate and maintain the system are also
26 becoming scarce. Implementing a new CIS on a modern, widely used software platform will
27 increase the pool of resources with the technology and business skills to support future
28 development and operations.

1 Modern CIS solutions reduce uncertainty and risk while increasing modularity⁴ and
2 flexibility because they are configurable and because changes can generally be implemented
3 more efficiently than with custom-developed applications. Packaged CIS solutions are also
4 regularly updated and enhanced by the software vendor to reflect industry best practices and
5 based on input from clients.

6 In contrast, making and deploying changes, enhancements, and fixes to the legacy CIS is
7 increasingly difficult, risky, and time-consuming due to the complexity of the system. Each
8 change increases the probability of introducing new defects and adds to the time and effort
9 required for testing. To support this level of testing, a large number of test environments with
10 supporting test data must be built and regularly maintained. In addition, deploying updates to the
11 legacy CIS requires a multi-step manual process to distribute the software to over 3,000
12 Company desktops and laptops. Every software release requires approximately four weeks of
13 testing to minimize chances of an emergency fix and subsequent re-distribution if the updates
14 introduce system issues. A modern CIS solution will simplify the implementation of changes,
15 reduce testing time, reduce time spent on test environment maintenance and software
16 distribution, and reduce the risk of introducing defects.

17 A new CIS will also allow SoCalGas to more efficiently implement new regulatory,
18 legislative, and business driven requirements. For example, in June 2020, the Commission
19 issued Decision (D.) 20-06-003 adopting several new rules and processes intended to reduce the
20 number of residential customer disconnections. To comply with this regulatory decision,
21 SoCalGas faced multiple challenges in making significant changes to long-standing business
22 processes across multiple legacy CIS sub-systems. These changes required lengthy and complex
23 modifications to the legacy CIS involving numerous system-specific resources and expertise.
24 Time-consuming manual processes were often necessary until system changes could be
25 implemented.⁵

26 Implementation of the Arrearage Management Plan (AMP) specified in D.20-06-003
27 posed significant challenges for SoCalGas. AMP offers qualifying customers the opportunity to

⁴ Modular programming usually makes software easier to understand and maintain by separating the software into functions that each only deal with one aspect of the overall functionality.

⁵ Manual processes can also be more prone to human error.

1 have their past due balances forgiven in exchange for regular on-time payment of current
2 balances. AMP necessitated several complex business rules including specific eligibility
3 requirements, enrollment processes, communications requirements, participation requirements,
4 and a debt forgiveness mechanism. The complex structure of AMP proved difficult and time-
5 consuming to implement in the legacy CIS. Until system changes could be implemented,
6 SoCalGas developed a temporary solution requiring a dedicated team of eight employees. The
7 team used manual processes for AMP participant intake and administration until fully automated
8 AMP processes were in place. Similarly, when mandated by the CPUC to automatically enroll
9 eligible customers into 24-month COVID-19 relief payment plans,⁶ SoCalGas needed double the
10 time required by San Diego Gas and Electric (SDG&E) to implement the changes in their new
11 modern CIS.

12 The difficulties and risks of implementing mandated changes in the legacy CIS have also
13 impacted SoCalGas operations. In March 2020, SoCalGas implemented changes to temporarily
14 suspend deposits and collections activity for residential and small business customers as part of
15 its compliance with the COVID-19 Emergency Customer Protections.⁷ The legacy CIS was not
16 designed to accommodate customers who were unable to pay for the extended periods of time
17 experienced during the COVID-19 pandemic or to stop the automated process of collecting
18 deposits. Implementation of deposit and collection suspensions affected the complex financial,
19 billing, and collections processes within the legacy CIS. The impacts of these changes were
20 significant and required extensive manual remediation by business and IT resources. With a new
21 CIS, SoCalGas does not anticipate facing these same types of challenges and will be able to
22 more effectively and efficiently implement new regulatory requirements.

23 SoCalGas and its customers will also benefit from continuous innovation, enhancements,
24 and support inherent to modern packaged software solutions. Modern CIS platforms have built-
25 in upgrade roadmaps that offer pathways for growth; they are built on cloud platforms that
26 provide scalability, stability, and resilience that may not be possible with the legacy technology.
27 Upgrading to a modern CIS will result in a “living” system that is sustainable and upgradeable.

⁶ D. 21-06-036, Ordering Paragraph (OP) 2.

⁷ See SoCalGas Advice Letter 5604-G-B, Implementation of Emergency Customer Protections to Support California Customers During the COVID-19 Pandemic Pursuant to Resolution M-4842 (June 22, 2020) available at: <https://tariff.socalgas.com/regulatory/tariffs/tm2/pdf/5604-B.pdf>.

1 Implementing a modern CIS also aligns with the SoCalGas information technology strategy as
2 outlined in the Information Modernization Technology Policy of Ben W. Gordon (Exhibit SCG-
3 2, Chapter 1). A modern CIS supports the IT strategy of simplifying and standardizing
4 infrastructure and applications; proactively managing lifecycle and cyber risk of infrastructure
5 and applications; transforming how the organization works to increase speed; embracing a
6 culture of innovation and constant learning; and accelerating digital.

7 In addition to meeting business and regulatory needs, a modern CIS will meet the service
8 and data access expectations of customers. The SoCalGas CIS serves as the primary source of
9 information for CSRs and branch office staff, and it provides the underlying information
10 supporting the IVR and digital customer experience channels. Customer data in the legacy CIS
11 is housed in various subsystems, which limits SoCalGas's ability to efficiently access and
12 analyze customer data and provide personalized customer service. Centralized data and
13 improved analytics capabilities in a modern CIS will allow for efficient and tailored customer-
14 centric experiences with consistency across engagement channels.

15 A modern CIS will also provide a platform to manage all customer communications and
16 notifications. Understanding if, when, and how customers respond to messaging sent through
17 various channels will enable SoCalGas to communicate with customers more effectively. The
18 legacy CIS is limited in its ability to track and understand customer interactions with SoCalGas
19 and identify where customers' experiences may not be optimal. These limitations restrict
20 SoCalGas's ability to make enhancements to reduce customer pain-points and meet customer
21 expectations.

22 A modern CIS can support analytics of customer behaviors and interactions, and the
23 resulting insights will enable targeted customer experiences and personalized program option
24 information delivered through multiple customer engagement channels. For example, when on
25 the phone with a customer, a customer service representative will be able view all programs
26 available to that customer. The representative can then engage, educate, and offer personalized
27 support to help make customers aware of and understand relevant programs.

28 SoCalGas is committed to consistently providing safe, secure, efficient, reliable, and
29 effective customer service. Many organizations across the private and public sectors have
30 significantly invested in improving customer service to make interactions simpler, faster, and
31 more convenient for customers. These investments and the resulting customer service

1 experiences have raised customer expectations for all providers, including SoCalGas. While
2 SoCalGas is proud of its commitment to customer service, it is becoming more challenging to
3 meet customer expectations given the age and limited capabilities of its legacy CIS. The
4 inability to provide a comprehensive view of customer data creates obstacles to providing a
5 consistent and positive customer experience. For example, the legacy CIS cannot store
6 centralized payment information, which restricts the ability of customers to seamlessly make
7 payments using their preferred channels or across a variety of different channels over time.
8 Customers currently may have to establish their preferred way to pay multiple times, depending
9 on whether the customer is accessing their account through web, mobile, interactive voice
10 response (IVR), or the contact center. A modern CIS will allow customers' designated payment
11 preferences to be reflected consistently across all channels. Multi-channel payment capabilities
12 simplify the customer experience and make it easier for customers to make timely and accurate
13 payments, and to access and maintain their payment information.

14 **III. SUSTAINABILITY**

15 The activities described in this testimony advance the state's climate goals and align with
16 SoCalGas's sustainability priorities as described in the Sustainability testimony of Michelle Sim
17 (Exhibit SCG-02, Chapter 2) and in the *ASPIRE 2045 SoCalGas Sustainability Strategy*.
18 Specifically, the proposed CIS Replacement Program will support progress in the sustainability
19 focus areas of:

- 20 • Accelerating the Transition to Clean Energy
- 21 • Protecting the Climate and Improving Air Quality in Our Communities
- 22 • Increasing Clean Energy Access and Affordability
- 23 • Advancing a Diverse, Equitable, and Inclusive Culture

24 Implementation of a modern CIS will improve SoCalGas's ability to more quickly
25 support and enable new products and services related to clean fuels delivery, customer
26 decarbonization, greenhouse gas emission reduction, and energy affordability in alignment with
27 the key SoCalGas sustainability focus areas listed above. In addition, the comprehensive
28 customer information enabled by a new CIS platform will allow SoCalGas to shift from more
29 transactional customer relationships to more influential relationships, which can help drive
30 adoption of such new offerings.

1 The following are some more specific examples of envisioned CIS Replacement Program
2 capabilities and how they can support one or more of the sustainability and climate policy focus
3 areas:

- 4 • New Customer Relationship Management capabilities to support SoCalGas
5 Account Executives in engaging with Commercial & Industrial customers on
6 achieving reductions in greenhouse gas emissions related to their energy
7 consumption, electric generation, and fleet/logistics activities.
- 8 • Advanced data analytics and marketing segmentation tools to help proactively
9 target customers for adoption of clean fuels programs (such as Renewable Natural
10 Gas (RNG) or Hydrogen).
- 11 • Next Best Action capabilities to prompt customer facing employees or self-
12 service channels to promote customer decarbonization or greenhouse gas
13 emission reduction opportunities as appropriate.
- 14 • Enabling a new centralized information hub to hold customer characteristics and
15 preferences to help SoCalGas address specific customer needs through their
16 preferred channels. This can support improved equity and inclusion outcomes
17 with respect to energy affordability, access to clean energy, and increased
18 economic opportunity across the diverse communities of customers served by
19 SoCalGas.

20 **IV. RISKS ASSOCIATED WITH SUSTAINING AND MODIFYING EXISTING CIS**

21 The age and limited capabilities of SoCalGas's legacy CIS have made it increasingly
22 challenging for SoCalGas to support the needs of its customers. Highly customized functions
23 and the addition of numerous integrated systems over the decades since CIS was first
24 implemented have significantly increased the complexity and fragility of the legacy systems
25 landscape. Customized programming necessary to implement new regulatory, legislative, and
26 business driven requirements over the years has resulted in a collection of very complicated and
27 tightly coupled systems in which each new change requires increased time, resources, and risk to
28 implement. This has resulted in a diminished ability to quickly and efficiently implement
29 regulatory and business requirements (often requiring interim manual solutions), limited
30 capabilities to provide premier customer service experiences, greater potential for system
31 failures, and increased maintenance costs.

1 Long modification and enhancement lead times remain a continued risk with SoCalGas's
2 legacy CIS. Other major California utilities have implemented modern CIS solutions. Without a
3 similar CIS replacement, SoCalGas will be more challenged to implement regulatory and
4 business driven changes in a timely manner compared with peer California utilities. In addition,
5 costs to maintain the outdated technology are likely to increase, and operations will become less
6 efficient due to increasing manual workarounds, system maintenance, and patches.

7 If SoCalGas does not replace its legacy CIS, it will become increasingly difficult to
8 support CPUC requirements. Future mandated billing and rate requirements and implementation
9 of new programs may require significant time and costs if deployed on legacy systems. At the
10 extreme, market conditions or regulatory mandates could necessitate a system change that would
11 be impossible to implement in the existing CIS leaving no immediate path forward and possibly
12 resulting in regulatory infractions and fines.

13 In addition, the existing CIS limits the ability of SoCalGas to deliver technology-based
14 customer service improvements to meet customer needs and expectations. Lack of centralized
15 data contributes to technology complexity and prevents a holistic, real-time view of customer
16 data. Such data constraints of the existing CIS limit the understanding of customers necessary to
17 deliver the expected modern service experience. For example, the legacy system lacks the
18 centralized data source and platform necessary to access, update, and share real-time customer
19 data to all departments, systems, and processes that require it, or to centrally manage all
20 customer communications and customer channel preferences. In contrast, a new CIS with this
21 ability will allow SoCalGas to be better able to proactively understand and respond to customer
22 needs and engage with them in ways and on platforms that they most prefer.

23 Given known challenges with similarly aged mainframe systems at other utilities,⁸
24 SoCalGas intends to proactively replace its legacy CIS before significant system failures begin.

⁸ SDG&E and Southern California Edison (SCE) each have experienced outages in their legacy CIS. See A.17-04-027, Prepared Direct Testimony of SDG&E Witness Scott Crider, *available at*: <https://www.sdge.com/sites/default/files/Chapter%25201%2520%2520Prepared%2520Direct%2520Testimony%2520of%2520Scott%2520Crider.pdf>; Prepared Direct Testimony of SDG&E Witnesses Charlie Snyder and Christopher Swartz, *available at*: <https://www.sdge.com/sites/default/files/Chapter%25202%2520Prepared%2520Direct%2520Testimony%2520of%2520Charlie%2520Snyder%2520and%2520Christopher%2520Swartz.pdf>; A. 21-07-009, Direct Testimony in Support of Southern California Edison Company's Request for Authorization to Recover Costs Recorded in its Customer Service RePlatform Memorandum Account

1 CIS failures could result in similar outages to those experienced by other utilities operating with
2 aged systems. Such failures may also have significant financial and operational impacts
3 including billing disruption, delayed revenue, increased IT support costs, reduced customer
4 service levels, diminished quality of customer experience, and increased customer complaint
5 calls. CIS and its related subsystems have become increasingly complex and fragile after years
6 of customization. Implementing even minor system changes carries a risk of negatively
7 impacting system functionality.

8 SoCalGas also risks continued increasing costs associated with maintenance of outdated
9 technology and limited availability of technical expertise. The system’s increasingly complex
10 and brittle architecture lacks automated or built-in upgrade pathways and requires time-
11 consuming maintenance, upgrade, and integrations work. The diminishing availability of
12 technical personnel who have knowledge of the custom-developed system or expertise in the
13 obsolete mainframe technology also adds to the risk of operating the aging system. Further, the
14 combination of obsolete technology platforms and languages and a rapidly retiring workforce
15 creates an elevated risk of critical and irreplaceable knowledge loss.

16 Limitations in the legacy CIS prevent integration with and availability of data among
17 various systems, channels, and processes. Data is neither stored centrally nor universally
18 available on a real-time basis to all departments, systems, and processes that need it. Rather,
19 relevant data is stored in multiple database systems and integrated via queries upon request.
20 Compiling and analyzing data from disparate sources is time-consuming and challenging as are
21 the manual workarounds, maintenance, and patches required in the outdated legacy CIS.

22 **V. TIMING OF CIS REPLACEMENT**

23 At the time of the CIS replacement implementation, SoCalGas’s legacy system will be
24 over 30 years old. The operational challenges and risks associated with the outdated system
25 necessitate that SoCalGas move expeditiously to implement a modern CIS. SoCalGas has
26 started the pre-planning process for the CIS Replacement Program and proposes to begin the
27 implementation project in 2024 and “go-live” with the new CIS in 2026. Planned deployment of

– Track 1 (Costs Through April 2021) at 6-8, *available at:*
<https://docs.cpuc.ca.gov/PublishedDocs/SupDoc/A2107009/3923/394807240.pdf>.

1 the new SoCalGas CIS would occur five years after the recent CIS implementations by SCE,
2 SDG&E, and Southwest Gas.

3 When determining the timing of the CIS Replacement Program, SoCalGas also
4 considered future capital requirements and operational impacts of a forthcoming Advanced
5 Meter Replacement Program. SoCalGas’s original Advanced Meter infrastructure will start to
6 reach the end of its expected life, and a replacement program is anticipated to begin in 2030. The
7 combined capital requirements for CIS and Advanced Meter Replacement Programs should be
8 coordinated carefully to mitigate overall rate impacts for customers. Implementing both
9 replacements concurrently would create program and operational risks due to the significant
10 scope, size, and complexity of each effort. For example, both CIS and Advanced Meter
11 Replacement Programs will depend on many common subject matter experts for requirements
12 development, design, and testing. Based on past experiences at SoCalGas and other utilities,
13 both programs will also require management of increased billing exceptions and billing backlogs
14 until systems and processes are stabilized after implementation. Executing both CIS and
15 Advanced Meter replacements at the same time could introduce an unmanageable number of
16 billing exceptions and unacceptable resolution times for billing backlogs. Starting the CIS
17 Replacement Program in the 2024 GRC timeframe mitigates issues involved with concurrent
18 implementation of these two major Customer Services programs.

19 **VI. SELECTION OF NEW CIS**

20 To determine potential CIS replacement options, an initial solution list was developed
21 leveraging industry analyst research, Accenture’s expertise, and SoCalGas’s specific business
22 requirements. Potential CIS solutions were evaluated for suitability against multiple criteria
23 including utility size, geography, market type, high-level functionality, and product relevance to
24 the utility sector.

25 The initial CIS solution list was narrowed to a short list of solution options by referencing
26 the solutions implemented by the largest 25 utilities⁹ in North America. The short list options
27 were then scored against a set of functional, technical, and cost criteria. Consideration was also
28 given to alignment with other major software systems deployed at SoCalGas and Sempra. Based
29 on the detailed evaluation, SoCalGas selected the cloud-based CIS solution from software

⁹ Size by number of meters.

1 vendor SAP SE (SAP) as the most suitable CIS replacement option. SAP is the core financial,
2 accounting, and enterprise resource planning solution for both SoCalGas and SDG&E, and
3 SDG&E also recently implemented SAP to replace its legacy CIS.

4 The SAP CIS solution aligns with the SoCalGas and SDG&E IT strategy. As discussed
5 in the Information Technology Modernization Policy testimony of Ben Gordon (Exhibit SCG-2,
6 Chapter 1), the four pillars of the IT strategy include simplifying and standardizing infrastructure
7 and applications, proactively managing risk, transforming work to increase speed, and
8 accelerating digital to prepare for rapid delivery of innovation. Cloud technologies like the SAP
9 CIS solution enable such innovation and are a cornerstone for the digital enablement that drives
10 faster business solutions.

11 SoCalGas intends to leverage lessons learned, best practices, and other key takeaways
12 from the SDG&E CIS replacement project. SAP's utility experience extends far beyond
13 SoCalGas and SDG&E. SAP is used by more than 1,000 utilities worldwide serving more than
14 500 million customers. SAP solutions can support both the volume of SoCalGas customers and
15 the complexity of large customer tariffs and billing scenarios.

16 **VII. CIS SOLUTION PLAN SCOPE**

17 After selecting SAP as the most suitable CIS replacement option, SoCalGas and
18 Accenture developed a CIS Solution Plan to identify the business and technical scope (*e.g.*,
19 business processes, systems interfaces, reports, etc.) of the CIS Replacement Program. The CIS
20 Solution Plan is based on Accenture's SAP CIS solution framework that has been leveraged at
21 multiple utilities across North America. The CIS Solution Plan identifies an inventory of 89
22 known business processes to include within the scope of the CIS Replacement Program.
23 SoCalGas then cross-validated the CIS Solution Plan inventory against current customer service
24 business processes plus future desired business capabilities. The CIS Solution Plan identifies 21
25 systems or subsystems that will be replaced by the new CIS, 6 systems that will be modernized,
26 and 55 systems that will require integration. The CIS Solution Plan also identifies specific
27 requirements for implementing the SAP CIS solution at SoCalGas. These requirements, called
28 "RICEFWs,"¹⁰ are a common method of planning and estimating SAP implementation efforts.

¹⁰ RICEFW stands for Reports (R), Interface (I), Conversion (C), Enhancements (E), Forms (F) and Workflow (W).

1 The CIS Solution plan includes an accompanying Organizational Change Management
2 (OCM) Plan to address organizational change management activities. Existing business
3 processes have been developed to function in conjunction with the legacy CIS. Implementation
4 of a new, modern CIS will result in significant changes to current business processes. Changes
5 are anticipated for a wide variety of business processes across the customer services
6 organization, including billing transactions and exceptions, administration of low-income
7 assistance programs, management of customer move-ins, creation and execution of marketing
8 campaigns, sending and receiving customer communications, and managing customer contracts.
9 The OCM Plan determines the scope, volume, and types of change management activities
10 needed to achieve the required adoption, utilization, and user proficiency of the CIS solution to
11 be implemented. Organizational change management activities will continue through the 2026
12 go-live and stabilization.

13 **VIII. CIS IMPLEMENTATION PLAN AND COST FORECAST**

14 After completing and validating the CIS Solution Plan and OCM Plan, SoCalGas and
15 Accenture then developed a CIS Implementation Plan and CIS Replacement cost forecast.
16 Accenture has extensive experience planning and delivering similar CIS projects at many utilities
17 in North America and worldwide, including SDG&E's CIS Replacement Program. Accenture's
18 CIS estimation framework was tailored to the SoCalGas-specific CIS Solution Plan and OCM
19 Plan to develop a project timeline, staffing model, and overall cost forecast. The CIS
20 Implementation Plan and cost forecast outline program phases and durations, determine internal
21 and external resources required for those phases, and calculate all costs required to achieve CIS
22 replacement defined in the CIS Solution Plan and OCM Plan.

23 The CIS Implementation Plan outlines six phases over 39 months beginning with the
24 Plan/Analyze Phase. During Plan/Analyze, SoCalGas will focus on clarifying responsibilities,
25 expectations, and deliverable timelines for internal teams and vendor partners. Activities during
26 this phase include planning and launching the program, confirming scope, finalizing resource
27 needs, and establishing program governance tools and processes. The Plan/Analyze Phase also
28 includes defining the technical architecture for the new CIS and integrated systems, as well as
29 linking system requirements to business processes and creating business process designs. An
30 analysis will be conducted to confirm and refine the RICEFWs initially identified in the CIS

1 Solution Plan. Finally, the Plan/Analyze Phase defines the approach for organizational change
2 management, testing, and data conversion.

3 The Plan/Analyze Phase is followed by the Design, Build & Validate Phase. This phase
4 involves the construction and configuration of the new CIS and its interfaces. During Design,
5 Build & Validate, SoCalGas will optimize process flows and design intuitive user interfaces.
6 Key activities during Design, Build & Validate include establishing and managing criteria for
7 entry and exit between deliverables, creating system and functional designs, and developing the
8 strategy for systems integration as well as reporting and analytics. The technical change
9 management strategy is also included in the Design, Build & Validate Phase along with the
10 approach to deployment. Most components required for implementation are developed during
11 this phase, including the validation and rationalization of RICEFWs, reporting and analytics
12 architecture, data integration and conversion frameworks, business process procedures, and the
13 product test plan. The Design, Build & Validate Phase also defines security access roles and
14 procedures. Change management activities within the organization commence during this
15 second phase.

16 After Design, Build & Validate, the program moves into the Test Phase. Testing includes
17 product, security role, reporting and analytics, and controls testing to validate that system
18 functionality is in alignment with requirements and designs. During the Test Phase, the
19 production environment is built, and dress rehearsals are held to practice conversion from the
20 legacy system to the new CIS. The operational readiness testing approach and the go-live
21 readiness criteria are also defined during this phase. Organizational change management
22 activities include change readiness assessment, role mapping and testing, identifying and moving
23 data into the training environment, and deploying training.

24 The Deploy Phase follows the Test Phase. During the Deploy Phase, SoCalGas will
25 practice end-to-end cutover plans and production-like operational activities to validate go-live
26 readiness criteria are satisfied. Testing will be conducted to confirm that processes and
27 procedures meet business needs, including the accuracy of bills produced in the new system. The
28 Deploy Phase includes a final dress rehearsal to confirm that the tasks, timing, and resources are
29 prepared and ready for a successful go-live. Defects identified will be triaged and fixed. During
30 the Deploy Phase, interim procedures are confirmed for operating during cutover.
31 Organizational change management includes continued training, deployment of new and

1 modified jobs, and ongoing change readiness assessment in anticipation of go-live. Operational
 2 Assurance activities begin during this phase including incremental staffing to backfill key
 3 operations personnel while they participate in training on the new CIS solution. The Deploy
 4 Phase also confirms post go-live support and stabilization plans.

5 Post Go-Live Stabilization is the final phase of the program. It includes the activities of
 6 implementation project personnel to stabilize the system after implementation and continued
 7 incremental Operational Assurance staffing for the contact center, billing, and collections teams
 8 to help mitigate any potential productivity dips and expedite program stabilization after go-live.

9 SoCalGas will focus on minimizing operational disruptions and stabilizing as quickly as
 10 possible. Activities during Post Go-Live Stabilization include resolving defects and monitoring
 11 day-to-day system, operational, and business performance metrics. Post Go-Live Stabilization
 12 also monitors business intelligence and analytics to identify optimization opportunities. A
 13 handover plan is created, and the CIS solution is transferred from the implementation project
 14 team to the SoCalGas ongoing production support team.

15 The CIS Implementation cost forecast is further detailed in Sections IX and X below and
 16 considers the cost of the SAP software solution and the SoCalGas and vendor partner resources
 17 necessary for the design, development, testing, implementation, and stabilization of the solution
 18 outlined in the CIS Solution Plan. SoCalGas and Accenture developed the resourcing forecasts
 19 based on Accenture experience with numerous SAP CIS implementations, discussions with
 20 SDG&E and other utilities about resourcing of their CIS replacements, and analysis by SoCalGas
 21 subject matter experts. A significant driver of the cost forecast is the estimated number of
 22 RICEFWs. Table EG-2 outlines the estimated RICEFWs from the CIS Solution Plan.

23 Table EG-2

RICEFW Forecast	Total	Simple (S)	Medium (M)	Complex (C)
Reports (R)	80	12	47	21
Interface (I)	274	75	142	57
Conversion (C)	46	11	26	9
Enhancement (E)	204	22	95	87
Form (F)	41	17	20	4
Workflow (W)	4	0	2	2
Total Count	649	137	332	180
Total %	100%	21%	51%	28%

24

The cost forecast accounts for the resources necessary for each project phase to support implementation of CIS business processes, technical implementation of the new solution, change management and training support, project management, testing, and remediation and integration of legacy applications. Table EG-3 shows required staffing resource roles by workstream.¹¹

Table EG-3

Workstream	Role Count
Functional	72
Technical	118
Change & Training	98
Project Mgt.	21
Testing	34
Legacy Apps	44
Total	387

Table EG-4 shows the labor and non-labor hours in each phase of the CIS Implementation Plan.

Table EG-4

	Plan/Analyze	DBV	Test	Deploy	PGLS	Total Hours
SoCalGas Hours	33,040	80,350	103,630	83,804	18,750	319,574
Contractor Hours	106,263	295,852	348,364	242,849	73,097	1,066,425
Total Hours	139,303	376,202	451,994	326,653	91,847	1,385,999

SAP software requirements and associated costs were identified based on consultation with both Accenture and SAP and input from SoCalGas subject matter experts.

The CIS cost forecast also includes quality assurance (QA) activities. SoCalGas plans to solicit a vendor partner to provide quality oversight for the entire CIS Replacement Program. The QA vendor will provide an independent and unbiased view of all work product and quickly raise risks to scope, schedule, budget, or quality. QA forecasted costs were developed based on

¹¹ Tables EG-3 and EG-4 do not include staffing resources for Operational Assurance or Quality Assurance. Costs for Operational Assurance and Quality Assurance are included in the total costs described below in Section IX.

1 consultation with SDG&E’s CIS Replacement Program team and input from SoCalGas subject
2 matter experts.

3 **IX. NON-SHARED O&M FORECAST**

4 **TABLE EG-5**
5 **Non-Shared O&M Summary of Costs**

TESTIMONY AREA (in 2021\$)			
O&M	2021 Adjusted-Recorded (\$000)	Estimated TY 2024 (\$000)	Change (\$000)
Non-Shared	\$ 1,815	\$ 20,247	\$ 18,482

6
7 “Non-Shared Services” are activities that are performed by a utility solely for its own
8 benefit. Corporate Center provides certain services to the utilities and to other subsidiaries. For
9 purposes of this general rate case, SoCalGas treats costs for services received from Corporate
10 Center as Non-Shared Services costs, consistent with any other outside vendor costs incurred by
11 the utility. Table EG-5 summarizes the total non-shared O&M forecasts for the listed cost
12 categories.

13 The TY 2024 O&M Request is based on the incremental project costs above Base Year
14 2021 recorded labor, which are added to determine total O&M funding requirements for the CIS
15 Replacement Program. Test Year O&M forecasts reflect a normalization of the estimated O&M
16 costs over the rate case period (2024-2027). The forecast method developed for the project costs
17 is derived from the cost estimate prepared by personnel experienced in this type of work and
18 with reference to recent projects of similar scope.¹²

19 **A. Description of Costs and Activities**

20 As outlined in the testimony above, these forecasted O&M expenditures reflect the need
21 for evolving customer service capabilities to be implemented by the CIS Replacement Program
22 in support of the Company’s goal to build the cleanest, safest, most innovative energy company
23 in America.

24 **B. Forecast Method**

25 The forecasting methodology for this project reflects a zero-based forecast for
26 incremental project costs above Base Year 2021 because there is no regular historical average for

¹² See Ex. SCG-13-WP, Supplemental Workpaper 2CI000.000 for forecast details.

1 reference. Cost estimates were obtained from vendor partners and provided by personnel
2 experienced in estimating projects with similar scope, schedule, and technical environments.

3 **C. Cost Drivers**

4 The forecast for labor and non-labor O&M is derived from the TY 2024 through 2027
5 four-year average cost for CIS Replacement Program O&M expenses. These expenses are
6 comprised of activities described above within the CIS Replacement Program Implementation
7 Plan Phases: Plan/Analyze Phase, Design, Build & Validate Phase, Test Phase, Deploy Phase,
8 and Post Go-Live Stabilization Phase.¹³

9 **X. CAPITAL COST FORECAST**

10 **TABLE EG-6**
11 **Capital Expenditures Summary of Costs**

TESTIMONY AREA (in 2021\$)					
	Estimated 2022 (\$000)	Estimated 2023 (\$000)	Estimated TY 2024 (\$000)	Estimated 2025 (\$000)	Estimated 2026 (\$000)
Capital					
Total CAPITAL	\$ 4,913	\$ 2,723	\$ 93,250	\$ 74,133	\$ 46,637

12
13 As shown in Table EG-6 above, SoCalGas forecasts to incur capital costs for the CIS
14 Replacement Program from 2022 – 2026, totaling \$221.7 million. Since the CIS Replacement is
15 forecasted to go in-service in 2026, funding is requested through the Post-Test Year Ratemaking
16 testimony of Khai Nguyen (Exhibit SCG-40). Additional information regarding CIS
17 replacement can be found in my capital workpapers.¹⁴

18 **A. Description of Costs and Activities**

19 These forecasted capital expenditures reflect the need for evolving customer service
20 capabilities to be implemented by the CIS Replacement Program in support of the Company’s
21 goal to build the cleanest, safest, most innovative energy company in America. Also included
22 within the Capital Forecast for the CIS Replacement Program are software costs for cloud-based
23 solutions. The IT industry is moving towards cloud-based solutions with software vendors, such

¹³ See Ex. SCG-13-WP, Supplemental Workpaper 2CI000.000 for CIS Replacement Program annual and project phase details.

¹⁴ See Ex. SCG-13-WP, Supplemental Workpaper 2CI000.000 for cost forecast details and drivers.

1 as Microsoft and SAP, now focused on Software as a Service (SaaS) solutions. This requires
2 that on-premise technology environments have cloud enablement and integration capabilities
3 available. Service management skills are also needed to ensure that usage is managed and
4 service levels from the vendor are met.

5 Beginning in 2024, SoCalGas is proposing to capitalize and amortize these costs for
6 regulatory recovery as long as the contracts meet SoCalGas's capitalization dollar thresholds.
7 Any renewals of the maintenance contracts would be O&M. These services are integral to the
8 successful operation of new hardware or software and should be considered an extension of the
9 asset. Please refer to Pat Moersen's Rate Base Testimony (Exhibit SCG-31) for the proposal.

10 **B. Forecast Method**

11 The forecasting methodology for this project reflects a zero-based forecast because there
12 is no regular historical average for reference. Cost estimates were obtained from vendor partners
13 and provided by personnel experienced in estimating projects with similar scope, schedule, and
14 technical environments.¹⁵

15 **C. Cost Drivers**

16 The forecast for Capital labor and non-labor is comprised of activities described within
17 the CIS Replacement Program Implementation Plan Phases: Plan/Analyze Phase, Design, Build
18 & Validate Phase, Test Phase, Deploy Phase, and Post Go-Live Stabilization Phase.
19 Documentation of these cost drivers is included as supplemental capital workpapers.¹⁶

20 **XI. CONCLUSION**

21 After receiving approval in the 2019 GRC to study CIS replacement, SoCalGas
22 conducted the thorough research and planning necessary to begin implementation of the new CIS
23 Replacement Program which is forecasted to go into service in 2026. The new CIS will replace
24 an outdated mainframe system that will be three decades old at the time of its replacement. CIS
25 is the technology foundation of numerous critical operations with the SoCalGas Customer
26 Services organization, and it is imperative that the legacy system is replaced prior to

¹⁵ *Id.*

¹⁶ *See* Ex. SCG-13-WP, Supplemental Workpaper 2CI000.000 for CIS Replacement Program annual and project phase details.

1 experiencing the types of failures experienced by comparable utilities using similarly aged
2 systems.

3 The O&M and Capital cost forecasts for CIS replacement were developed through a
4 rigorous analysis and comprehensive review process based on a framework provided by a global
5 industry leader in CIS solution implementations. The resulting forecasts project the funding
6 necessary to implement a modern CIS solution which will enable the capability and agility
7 necessary to meet increasingly complex California regulatory requirements, support SoCalGas
8 sustainability priorities, and keep pace with the rapidly changing energy industry and evolving
9 service demands of customers.

10 Therefore, SoCalGas respectfully requests approval to proceed with and obtain cost
11 recovery for the CIS Replacement Program, including recovery of O&M in this GRC for
12 expenses related to the CIS implementation forecasted to go into service in 2026. The CIS
13 Replacement Program Capital funding is requested through the Post-Test Year Ratemaking
14 testimony of Khai Nguyen (Exhibit SCG-40).

15 This concludes my prepared direct testimony.

1 **XII. WITNESS QUALIFICATIONS**

2 My name is Evan D. Goldman. I am employed by SoCalGas, and my current position is
3 CIS Replacement Program Manager where I have overall responsibility for the planning and
4 organization of the CIS Replacement Program. My business address is 555 West Fifth Street,
5 Los Angeles, CA 90013. I have over 25 years of experience with utility customer service
6 operations and technology. At SoCalGas I have held a variety of management positions in
7 customer services, customer engagement, information technology, and regulatory affairs. Prior
8 to joining SoCalGas, I was a management and technology consultant focusing on Customer
9 Information Systems and customer service business processes for utility industry clients. I
10 received a Bachelor of Arts degree in Business Economics from the University of California at
11 Santa Barbara.

12 I have previously testified before the Commission.
